Common Lab Experiments and Their Answers

1. Measuring Acceleration Due to Gravity

One of the foundational experiments in Physics 207 involves measuring the acceleration due to gravity (g) using pendulums or free-fall methods.

Experiment Objective: Determine g by timing the period of a pendulum or measuring the free-fall time over a known distance.

Typical Procedure: Use a stopwatch or photogate timer to record multiple periods or fall times.

Sample Answer: Calculations involve using the formula $(g = \frac{4\pi^2 L}{T^2})$, where L is the length of the pendulum and T is the period. The manual provides a step-by-step calculation guide to determine g accurately.

2. Conservation of Momentum

This experiment explores elastic collisions between carts or pendulums.

Experiment Objective: Verify the conservation of momentum and kinetic energy in elastic collisions.

Procedure Highlights: Measure initial velocities, conduct collisions, and record final velocities.

Sample Answer: Use momentum formulas $(p = mv)$ and kinetic energy $(KE = \frac{1}{2}mv^2)$ to compare initial and final values, demonstrating conservation principles.

3. Rotational Motion and Moment of Inertia

Students investigate rotational dynamics using rotating disks or beams.

Experiment Objective: Calculate the moment of inertia for various objects and compare with theoretical predictions.

Procedure Highlights: Measure angular acceleration under applied torque.

Sample Answer: Use the relation $(\tau = I \alpha)$, where (τ) is torque, (I) is moment of inertia, and (α) is angular acceleration. The manual guides through data analysis to derive I values.
