learning and accuracy. Sample Laboratory Exercises with Detailed Descriptions

Measuring the Acceleration Due to Gravity Using a Pendulum

Objective: To determine the value of gravitational acceleration (g) using a simple pendulum.

Apparatus: Meter scale, Stopwatch, Rigid stand and string, Bob (mass attached to the string)

Procedure: Measure the length (L) of the pendulum from the pivot point to the center of mass of the bob. Displace the pendulum by a small angle ($<15^\circ$) to ensure simple harmonic motion. Release the bob without pushing to avoid additional velocity. Use the stopwatch to measure the time (T) for 20 oscillations. Calculate the period ($T = T/20$). Use the formula $g = \frac{4\pi^2 L}{T^2}$ to find g .

Analysis: Compare the experimentally obtained value of g with the standard value (9.81 m/s^2). Discuss potential sources of error such as timing inaccuracies or amplitude effects.

Determining Specific Heat Capacity of a Metal

Objective: To find the specific heat capacity (c) of a metal using calorimetry.

Apparatus: Calorimeter, Metal sample (e.g., copper or aluminum), Thermometer, Electric heater or hot water bath, Balance for mass measurement

Procedure: Measure the mass (m) of the metal sample. Heat the metal to a known temperature (T_{hot}) using an electric heater or hot water bath. Record the initial temperature of hot water (T_{hot}) and the calorimeter's temperature (T_{initial}). Immerse the hot metal in the calorimeter containing a known mass of water at room temperature (T_{initial}). Stir gently and record the final equilibrium temperature (T_{final}). Calculate c using the heat exchange equation: $m_{\text{metal}} c_{\text{metal}} (T_{\text{hot}} - T_{\text{final}}) = m_{\text{water}} c_{\text{water}} (T_{\text{final}} - T_{\text{initial}})$

Analysis: Calculate the specific heat capacity and compare it with literature values. Discuss experimental errors such as heat loss to surroundings.
