Fundamental Concepts in Ordinary Level Chemistry 1. Matter

and Its States
Definition and Characteristics
 Matter is anything that has mass and occupies space. It exists predominantly in three physical states:
Solid: Definite shape and volume; particles are tightly packed and vibrate in fixed positions.
Liquid: Definite volume but indefinite shape; particles are close but can flow past each other.
Gas: Neither definite shape nor volume; particles are far apart and move freely.
Transitions Between States
 Changes such as melting, boiling, condensation, freezing, sublimation, and deposition involve energy transfer and are governed by temperature and pressure conditions.

2. Atomic Structure
The Atom: Building Block of Matter
 Atoms are the smallest units of chemical elements, composed of:
Protons: Positively charged particles in the nucleus, defining the atomic number.
Neutrons: Neutral particles in the nucleus, contributing to atomic mass.
Electrons: Negatively charged particles orbiting the nucleus in shells or energy levels.
Atomic Number and Mass Number
Atomic Number (Z): Number of protons; defines the element.
Mass Number (A): Sum of protons and neutrons.
Isotopes
 Atoms of the same element with different neutron counts, leading to variations in atomic mass but not chemical properties.

3. The Periodic Table
 Organized in increasing atomic number, the periodic table arranges elements into periods (rows) and groups (columns) based on similar properties.
Key Features:
 Elements in the same group exhibit similar chemical behaviors. Metals, non-metals, and metalloids are distinguished by position. Trends such as atomic radius, electronegativity, ionization energy, and reactivity are predictable across periods and groups.

Chemical Bonding and Compounds
1. Types of Chemical Bonds
 Understanding how atoms combine is crucial; the main types are:
Ionic Bonds: Formed when electrons are transferred from one atom (usually a metal) to another (usually a non-metal), creating ions that attract each other. Example: Sodium chloride (NaCl).
Covalent Bonds: Formed when atoms share electron pairs, common among non-metals. Example: Water (H₂O).
Metallic Bonds: In metals, atoms share a 'sea' of delocalized electrons, contributing to properties like conductivity.

2. Molecules and Compounds
Molecules: Two or more atoms bonded chemically. Diatomic molecules like O₂ and N₂ are common.
Compounds: Substances formed from different elements in fixed ratios, exhibiting unique properties. For instance, carbon dioxide (CO₂) is different from its constituent elements.

Empirical and Molecular Formulas
 The empirical formula shows the simplest ratio of elements. The molecular formula indicates the actual number of atoms in a molecule.

Chemical Reactions and Equations
1. Types of Chemical Reactions
Combustion: Rapid oxidation producing heat and light, e.g., burning hydrocarbons.
Decomposition: Breakdown of a compound into simpler substances, often via heating.
Displacement: One element replaces another in a compound.
Acid-Base Reactions: Transfer of protons (H⁺), leading to neutralization.
Precipitation: Formation of insoluble solids from solutions.

2. Balancing Chemical Equations
 Ensuring conservation of mass, equations are balanced by adjusting coefficients. For example:
 Unbalanced: $\text{H}_2 + \text{O}_2 \rightarrow \text{H}_2\text{O}$
 Balanced: $2 \text{H}_2 + \text{O}_2 \rightarrow 2 \text{H}_2\text{O}$

3. Stoichiometry
 Calculating quantities involved in reactions, such as moles, mass, and volume, using molar ratios derived from balanced equations, is fundamental for practical chemistry.

Acids, Bases, and Salts
1. Acid-Base Theories
Arrhenius Theory: Acids release H⁺ ions; bases release OH⁻ ions in aqueous solutions.
Brønsted-Lowry Theory: Acids donate protons; bases accept protons.
Lewis Theory: Acids accept electron pairs; bases donate electron pairs.

pH Scale
 Range from 0 to 14, indicating acidity (<7), neutrality (=7), or alkalinity (>7). pH is measured

using indicators or pH meters.

2. Salts and Their Formation

Salts are formed when acids react with bases (neutralization). They consist of positive and negative ions. Examples include sodium sulfate (Na_2SO_4) and potassium nitrate (KNO_3).

Organic Chemistry Basics

1. Introduction to Organic Compounds

Organic chemistry studies carbon-containing compounds. Key features include:

- Covalent bonding
- Functional groups (e.g., hydroxyl, carboxyl, amino)

Common Organic Compounds:

- Alkanes (saturated hydrocarbons, e.g., methane)
- Alkenes (unsaturated hydrocarbons with double bonds)
- Alcohols, acids, and esters

2. Isomerism

Compounds with the same molecular formula but different structures or arrangements:

- Structural isomers
- Geometric isomers
- Optical isomers

Environmental and Practical Applications
