## Engineering economy 15th edition problem 1 solution

engineering economy 15th edition problem 1 solution: A Comprehensive Guide to Understanding and Solving the First Problem

Understanding the concepts and solutions in engineering economy is essential for students and professionals involved in project evaluation, cost analysis, and decision-making processes. The 15th edition of Engineering Economy offers numerous problems designed to enhance practical understanding. Among these, Problem 1 often serves as an introductory exercise that lays the foundation for more complex analyses. This article provides an in-depth, step-by-step solution to Problem 1 from the 15th edition, along with explanations of relevant concepts and methodologies to ensure clarity and reinforce learning.

### Overview of Engineering Economy and Its Significance

Before delving into the specific problem, it's important to grasp the broader context of engineering economy. What is Engineering Economy? Engineering economy involves applying economic principles to evaluate the cost-effectiveness of engineering projects and alternatives. It aids in making informed decisions by comparing the costs and benefits over the lifespan of projects or investments.

### Key Concepts in Engineering Economy

**Present Worth (PW):** The current value of a series of future cash flows discounted at a specific interest rate.

**Future Worth (FW):** The value of cash flows at a specified future date.

**Annual Worth (AW):** The uniform annual equivalent of cash flows over the project life.

**Interest Rate (i):** The rate used to discount future cash flows to their present value.

**Reinvestment and Capital Recovery:** Considerations involved in project evaluations.

### Understanding Problem 1 from the 15th Edition

Although the specific details of Problem 1 vary by edition, the problem generally involves evaluating projects or investments based on given cash flows, interest rates, or lifespans. To illustrate, let's consider a typical problem scenario:

**Sample Problem Statement:** > "Determine the most economical alternative among three proposed projects, given their initial costs, annual operating costs, salvage values, and project lifespans. Assume an interest rate of 8% compounded annually." The aim is to identify which project offers the best economic value using the principles of engineering economy.

### Step-by-Step Solution Approach

To solve such problems efficiently, follow a systematic process:

- 1. Gather Data and Define Assumptions**
  - Identify all relevant data: Initial cost ( $C$ ), Annual operating costs ( $A$ ), Salvage value ( $S$ ), Lifespan ( $n$ ), Interest rate ( $i$ ).
  - Assumptions: The projects are mutually exclusive. Cash flows occur at the end of each year unless specified otherwise. The interest rate remains constant over the project durations.
- 2. Choose the Appropriate Method of Analysis**
  - Depending on the data, select among:
    - Present Worth Analysis:** Suitable when comparing projects with different lifespans.
    - Annual Worth Analysis:** Useful for uniform comparison over different periods.
    - Future Worth Analysis:** When future values at a specific date are relevant.
- 3. Calculate Present Worth (PW) of Each Alternative**
  - The

general formula for present worth considering initial costs, annual costs, and salvage value is:
$$PW = -C_0 - A \times P/A(i, n) + S \times P/F(i, n)$$
Where:
$$P/A(i, n)$$
 is the Present Worth of a series of 1 per year for  $(n)$  years.
$$P/F(i, n)$$
 is the Present Worth of a single future sum after  $(n)$  years.  
Formulas:
$$P/A(i, n) = \frac{1 - (1 + i)^{-n}}{i}$$
$$P/F(i, n) = \frac{1}{(1 + i)^n}$$
  
4. Calculate the Present Worth for Each Project  
Compute  $(P/A)$  and  $(P/F)$  using the provided data and plug into the formula.  
Example Calculation: Suppose Project A has: Initial cost  $(C_0 = \$50,000)$  Annual operating costs  $(A = \$5,000)$  Salvage value  $(S = \$10,000)$  Lifespan  $(n = 10)$  years Interest rate  $(i = 8\%)$   
Calculate:
$$P/A(0.08, 10) = \frac{1 - (1 + 0.08)^{-10}}{0.08} \approx 6.710$$
$$P/F(0.08, 10) = \frac{1}{(1 + 0.08)^{10}} \approx 0.463$$
  
Then:
$$PW_A = -50,000 - 5,000 \times 6.710 + 10,000 \times 0.463$$
$$PW_A = -50,000 - 33,550 + 4,630 = -78,920$$
  
Repeat for other projects.  
5. Make a Comparative Analysis  
Once the present worths are calculated for all alternatives, compare the values: The project with the least negative (or highest) present worth is considered the most economical.  
6. Additional Considerations  
If projects have different lifespans, consider the Common Life Method or Replacement Analysis. For projects involving significant salvage values, ensure they are appropriately discounted. Sensitivity analysis can be performed to assess the impact of interest rate changes.  
Example: Complete Solution for Multiple Projects  
Let's analyze three hypothetical projects:  

| Project | Initial Cost (\$) | Annual Cost (\$) | Salvage (\$) | Life (years) |
|---------|-------------------|------------------|--------------|--------------|
| A       | 50,000            | 5,000            | 10,000       | 10           |
| B       | 60,000            | 4,000            | 12,000       | 12           |
| C       | 55,000            | 4,500            | 9,000        | 9            |

  
Assuming an interest rate of 8%, calculations would proceed as outlined previously.  
Interpreting Results and Making Decisions  
After calculating the present worth for each project, the decision hinges on economic efficiency: The project with the highest present worth (least negative or most positive) is the most economical. If all projects have negative present worths, none may be economically justified, prompting reconsideration of alternatives.  
Note: Always consider qualitative factors and strategic fit in addition to quantitative analysis.  
Additional Tips for Solving Engineering Economy Problems  
Check Data Consistency: Ensure all cash flows are appropriately discounted or compounded.  
Use Tables and Software: Engineering economy tables or software like Excel can expedite calculations.  
Understand the Context: Know whether to analyze on an annual, present, or future basis based on project characteristics.  
Beware of Assumptions: Be clear about assumptions regarding interest rates, project lifespans, and cash flow timings.  
Conclusion: Mastering Engineering Economy Problem 1  
Mastering the solution to Problem 1 from the 15th edition of Engineering Economy requires understanding fundamental concepts, applying systematic analysis steps, and interpreting results effectively. By familiarizing yourself with the key formulas and methodologies such as present worth calculations, annual worth analysis, and common life adjustments you can confidently evaluate engineering projects and make economically sound decisions. Remember, practice with various datasets and problem types enhances proficiency. As you progress, integrating qualitative considerations with quantitative analysis will lead to more comprehensive project evaluations, ultimately making you a more effective engineer or decision-maker in the field.

Engineering Economy 15th Edition Problem 1 Solution: A Comprehensive Guide to Approach and Resolve

When tackling problems from Engineering Economy, 15th Edition, Problem 1 often serves as an introductory yet vital exercise that sets the tone for understanding fundamental economic decision-making in engineering projects. This problem typically involves analyzing costs, benefits, and economic feasibility of a proposed project or investment, requiring a clear grasp of concepts like present worth, annual worth, and rate of return. In this guide, we will break down the solution approach systematically, providing a detailed step-by-step methodology that can be applied to similar problems in the book and beyond.

### Understanding the Context of Engineering Economy Problems

Before diving into calculations, it's essential to understand the core purpose of these problems: to evaluate different alternatives based on their economic merits. The goal is to identify the most cost-effective or profitable option considering factors such as initial costs, operating expenses, salvage values, and project lifespans.

### Key concepts often involved include:

- Present Worth (PW):** The current equivalent of a series of future cash flows.
- Annual Worth (AW):** The equivalent uniform annual amount over the project's life.
- Internal Rate of Return (IRR):** The discount rate that makes the net present value of cash flows zero.
- Payback Period:** Time needed to recover the initial investment.

### Step 1: Carefully Read the Problem and Extract Data

Begin by identifying all relevant data points provided:

- Initial investment costs
- Operating and maintenance costs
- Salvage or residual values
- Project lifetimes
- Discount or interest rate
- Any revenue or cost savings

Tip: Make a list or table of these data to clarify the inputs for your calculations.

### Step 2: Determine the Appropriate Economic Analysis Method

Depending on the problem specifics, select the most suitable analysis:

- Present Worth Analysis:** For comparing alternatives over a common time horizon.
- Annual Worth Analysis:** When comparing projects with different lifespans or to determine equal annual costs.
- Rate of Return Calculation:** To find the profitability rate of an investment.
- Payback Period:** For quick assessments of investment recoverability.

Often, problems in Engineering Economy require calculating the present worth of costs or benefits and then making decisions based on comparisons.

### Step 3: Calculate Present Worth (PW)

The core calculation involves bringing all cash flows to their present value using the given interest rate. For each alternative:

- Identify Cash Flows:** Initial costs, annual costs/benefits, salvage values.
- Use Present Worth Formulas:**
  - For a uniform series (like annual costs or benefits):  

$$PW = A \times P/A(i, n) + F \times P/F(i, n)$$
  - Where:
    - $A$  = annual cash flow
    - $F$  = future (salvage) value
    - $i$  = interest rate per period
    - $n$  = number of periods
    - $P/A(i, n)$  = present worth factor of a uniform series
    - $P/F(i, n)$  = present worth factor of a future sum
  - Example formulas:  

$$P/A(i, n) = \frac{1 - (1 + i)^{-n}}{i}$$

$$P/F(i, n) = \frac{1}{(1 + i)^n}$$
- Sum all discounted cash flows to determine the total present worth.

### Step 4: Calculate Annual Worth (if applicable)

Converting the present worth to an equivalent annual amount helps compare alternatives with different lifespans:

$$AW = PW \times A/P(i, n)$$

Where:

$$A/P(i, n) = \frac{i(1 + i)^n}{(1 + i)^n - 1}$$

This allows a straightforward comparison of options in uniform annual terms.

### Step 5: Make the Decision

Compare the calculated values:

- For cost analysis, the alternative with the lowest present worth or annual cost is generally preferable.
- For investment projects, the highest net present value or internal rate of return is preferred.

Consider

qualitative factors such as risk, project feasibility, and strategic fit. Practical Example: Hypothetical Scenario Let's illustrate with a simplified example inspired by typical Engineering Economy problems: Given Data: Alternative A: Initial cost: \$50,000 Annual operating cost: \$5,000 Salvage value after 10 years: \$10,000 Discount rate: 8% Project life: 10 years Solution Approach: Calculate present worth of operating costs:  $PW_{\text{operating}} = 5,000 \times P/A(8\%, 10)$  Calculate present worth of salvage value:  $PW_{\text{salvage}} = 10,000 \times P/F(8\%, 10)$  Total present worth:  $PW_{\text{total}} = 50,000 + PW_{\text{operating}} - PW_{\text{salvage}}$  Convert to annual worth:  $AW = PW_{\text{total}} \times A/P(8\%, 10)$  Compare with alternative options using the same process. Additional Tips for Solving Engineering Economy Problems Always double-check the period units: Are cash flows annual, semi-annual, or otherwise? Use financial tables or calculator functions for  $(P/A)$ ,  $(P/F)$ , and  $(A/P)$  factors. Be consistent with the interest rate and time period units. Document each step clearly to avoid errors and facilitate review. Final Thoughts: Mastering the Art of Economic Decision-Making Solving Engineering Economy 15th Edition Problem 1 effectively hinges on a systematic approach? careful data extraction, selecting the appropriate analysis method, precise calculations, and thoughtful decision-making. As you become more familiar with the standard formulas and concepts, these problems will become more intuitive, enabling you to analyze complex projects confidently. Remember, the key to success is not just getting the right answer but understanding the underlying principles and assumptions. Practice with various scenarios to sharpen your skills, and always approach each problem with a clear strategy. In conclusion, mastering the solution of Engineering Economy 15th Edition Problem 1 provides a strong foundation for analyzing and evaluating engineering investments. By following this structured guide, you can confidently approach similar problems, ensuring thoroughness and accuracy in your economic assessments.
